-!- FUNCTION: Catalyzes the formation of alpha-ketobutyrate from threonine in a two-step reaction. The first step is a dehydration of threonine, followed by rehydration and liberation of ammonia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  COFACTOR: PYRIDOXAL PHOSPHATE (BY SIMILARITY).
ENZYME REGULATION: Allosterically inhibited by isoleucine. Strain
GM11b is isoleucine feedback insensitive and is resistant to the

"Complete genome sequence of Salmonella enterica serovar Typhimurium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ENZYME REGULATION: EACH PROTEIN MOLECULE CAN BIND UP TO FOUR MOLECULES OF AMP, WHICH ACTS AS AN ALLOSTERIC ACTIVATOR TO THE ENZYME. THE ENZYME IS ALSO INHIBITED BY ALPHA-KETO ACIDS AND OTHER CATABOLITES. IT IS ALLOSTERICALLY INHIBITED BY ISOLEUCINE AND ALLOSTERICALLY ACTIVATED BY VALINE.

PATHWAY: Threonine catabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        7 ISFADVEKAHINIRDSIHLTPVLTSSILNQLTGRNLFFKCELFQKTGSFKIRGALNAVRS

Paustian M.L., Whittam T.S., Kapur V.; "Complete genomic sequence of Pasteurella multocida Pm70."; Proc. Natl. Acad. Sci. U.S.A. 98:3460-3465(2001).

-!- FUNCTION: Catalyzes the formation of alpha-ketobutyrate from threonine in a two-step reaction. The first step is a dehydration of threonine, followed by rehydration and liberation of ammonia.
-!- CATALYTIC ACTIVITY: L-threonine + H(2)0 = 2-oxobutanoate + NH(3) +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VYDVAQVTPLQDMAKLSERLGNKVFIKREDRQPVHSFKLRGAYAMIAGL---SAEQKASG

Submitted (SEP-1995) to the SWISS-PROT data bank.
-!- FUNCTION: Catalyzes the formation of alpha-Ketobutyrate from
threonine in a two-step reaction. The first step is a dehydration
of threonine, followed by rehydration and liberation of ammonia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STRAIN=RG / KW20 / ATCC 51907;

The first step is a dehydration of threonine, followed by rehydration and liberation of ammoniation of ammoniation and Liberation of Liberation of Liberation of Liberation of Liberation of Experiments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PATHWAY: Isoleucine biosynthesis; first step. SIMILARITY: BELONGS TO THE SERINE/THREONINE DEHYDRATASE FAMILY.
                                                                                                                                                                                                                                                                                                                     Sorokin A.V., Azevedo V., Zumstein E., Galleron N., Ehrlich S.D.,

Submitted (NOV-1995) to the EMBL/GenBank/DDBJ databases.
-:- FUNCTION: Catalyzes the formation of alpha *ketobutyrate from
threonine in a two-step reaction. The first step is a dehydration
of threonine, followed by rehydration and liberation of ammonia.
-:- CATALYTIC ACTIVITY: L-threonine + H(2)0 = 2-oxobutanoate + NH(3) +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

--- FUNCTION: Catalyzes the formation of alpha-ketobutyrate from threonine in a two-step reaction. The first step is a dehydration of threonine, followed by rehydration and liberation of ammonia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COFACTOR: PYRIDOXAL PHOSPHATE (BY SIMILARITY).
ENZYME REGULATION: Allosterically inhibited by isoleucine. Strain.
GM11b is isoleucine feedback insensitive and is resistant to the
